Abstract: The effects of Lactuca sativa (Lactuca) extracts on the corrosion of aluminum in 1M HCl were investigated as environmentally safe corrosion inhibitors using Potentiodynamic polarization and weight loss measurements. Surface morphology was tested by scanning electron microscopy (SEM). The results show that inhibition efficiencies increased with increase in extract concentrations. The adsorption of the inhibitor extract on aluminum surface is spontaneous and obeys Langmuir’s isotherm. The results obtained from polarization measurements indicate that the Lactuca sativa (Lactuca) extracts act as mixed-type inhibitor with predominant anodic effectiveness.

Keywords: Hydrochloric acid, Corrosion inhibition, Green Leafy Vegetables, Adsorption

1. Introduction

Aluminum is one of the most widely used metals, in competition with steel, and increasingly utilized in the fields of architecture, transportation, and public works[1-5]. Aluminum is used excessively in the modern world, and the uses of the metal are extremely diverse due to its many unusual combinations of properties as low cost, low density, good corrosion resistance, excellent electrical and thermal conductivities[6-8]. The corrosion resistance of aluminum and its alloys comes from the compact film on the metal surfaces upon exposure to the atmosphere or aqueous solutions, but the film will not protect the aluminum surface in corrosive media that contain high chloride concentrations[9,10]. A great number of investigations have been done to find effective inhibitors for aluminum corrosion in harsh environments[11,12] some researcher studied the use of chemical inhibitors and the effect of organic oxidants while others studied the use of organic compounds, the corrosion can be controlled by the selection of highly corrosion resistant materials with the considerations of toxicity, availability, cost and environmentally safe which mean the replacement of some toxic, expensive chemical inhibitors by inhibitors obtained from natural source. Recently, natural products as plant extracts which contain natural chemical compound have been used as corrosion inhibitors in many corrosion systems[13], which can be extracted by simple procedures with low cost provide both environmental and economic benefits.

The main aim of this work is to investigate the corrosion inhibition of aluminum in 1M HCl by the extracts of Lactuca sativa (Lactuca) using weight loss, Potentiodynamic polarization measurements and scanning electron microscopy (SEM).

2 Experimental

2.1 Materials and solution

Pure aluminum electrodes with exposed surface area of 1 cm² were exposed to electrolytes, the electrodes were ground with 800 and 1200 grit grinding papers and rinsed with distilled water and acetone. The electrochemical cell was a three-electrode all-glass cell, with a platinum counter electrode and saturated calomel reference electrode.

Fourier transforms infrared spectroscopy (FT-IR): A KBr pellet was made from the dried extract and was characterized using FT-IR (Nicolet's auxiliary experiment module - AEM, Omnic software).

Preparation of plant extract:

GLV were dried in an electric furnace for 10 - 20 min at 50°C then ground to powder. GLV dried powder (5g) were mixed with 500 ml of 1 M HCl and refluxed at 50°C for 2 h. The extracts were cooled, and filtered through Whatman filter paper. The filtrate was then kept as the stock solution. Working solutions of different concentrations ranging from 20 to 60 % (v/v) were prepared from the stock solutions by dilution with 1 M HCl solution.

Test solutions

The test were performed in 1M HCl solution with the addition of various concentrations of GLV extract, for each run, freshly prepared solution was used.
During the experiments, the test solutions were opened to the air and experiments were performed under static conditions. The temperature of the test solution was controlled by immersing the cell in a water thermostat.

2.2 Weight loss measurements
Specimens of aluminum were used for weight loss measurements. The cleaned and dried specimens were completely immersed in 100 ml of 1M HCl solution with and without inhibitor for a period of 3-12 h the specimens were washed, dried and weighed using analytical balance. The weight loss was calculated in different concentrations of the inhibitor (0.1-0.5 g/l) and temperature (298K).

2.3 Potentiodynamic polarization measurements
Electrochemical measurements were carried out using ACM instruments model 1783. The electrochemical cell consisted of a conventional three-electrode configuration with graphite as the counter electrode and a saturated calomel electrode (SCE) coupled with a Luggin-Haber capillary as the reference electrode. The tip of the Luggin capillary was placed very close to the surface of the working electrode in order to minimize the ohmic contribution.

The working electrode was prepared from aluminum with area exposed to solution of one cm².

The working electrode was immersed in test solutions in which the mixtures included 1 M HCl at 25°C with and without the inhibitor.

The polarization curves were obtained potentiodynamically with a scan rate of 0.2 mVs⁻¹ in the potential range of ±250 mV proportional to the potential of corrosion.

2.4 Scanning electron microscope (SEM):
Surface morphology of aluminum surface was examined after the required experiments using scan electron microscopy (SEM) model JSM-6380 LA with a high resolution of 3.0 nm and an accelerating voltage of 0.5 to 30 kV.

3. Result and dissection
3.1 FTIR results of GLV extracts
The important IR absorption bands of inhibitors are given in Fig. 1 and their respective FT-IR peaks are in Table 1. These results showed that the inhibitors containing functional groups with O and N atoms and other attached to aromatic ring, which commonly gather in corrosion inhibitors.

3.2. Weight loss measurement

From the weight loss measurements of aluminum specimens in 1M HCl in the absence and presence of different concentrations Lactuca sativa of extract at 298K, the corrosion rate and inhibition efficiency were calculated and the results are shown in Table 2.

The inhibition efficiency ηw % and the corrosion rate C\text{corr} are calculated using Eqs. (1) and (2), respectively [14-15].

\[ \eta_w = \frac{C_{\text{corr}} - C_{\text{corr0}}}{C_{\text{corr0}}} \times 100 \]  
\[ C_{\text{corr}} = \frac{W}{At} \]  

where \( C_{\text{corr}} \) is the corrosion rate (mg cm\(^{-2}\) h\(^{-1}\)) in the presence of inhibitor
\( C_{\text{corr0}} \) is the corrosion rate (mg cm\(^{-2}\) h\(^{-1}\) in the absence of inhibitor
\( W \) is the weight loss (mg)
\( A \) is the exposed surface area (cm\(^2\))
\( t \) is the exposure time (h)

The results indicate a decrease in the corrosion rate of aluminum in the presence of Lactuca sativa (Lactuca) extract as shown in Table 2, and the corrosion rate decrease with the increase in the concentration of Lactuca sativa (Lactuca) extract, the inhibition efficiency increase with the presence of Lactuca sativa (Lactuca) and the inhibition efficiency increases with the increase in the concentration of the corrosion inhibitor extract. The results indicate that the inhibitor extract decrease the corrosion rate of aluminum in HCl at all concentration used in this study and this result is most likely due to the adsorption of the organic compounds present in Lactuca sativa extract on aluminum surface [16-19].

3.2 Potentiodynamic polarization measurements

Fig.2 presents the potentiodynamic polarization curves of aluminum in 1M HCl with different concentrations of Lactuca sativa extracts at 298K. The electrochemical parameters i.e., corrosion potential (\( E_{\text{corr}} \)), corrosion current density (\( i_{\text{corr}} \)), anodic Tafel constant (\( \beta_a \)), cathodic Tafel constant (\( \beta_c \)), were calculated from tafel plots and shown in Table 3.

Potentiodynamic polarization curves indicate that the Lactuca sativa extracts caused a decrease in both anodic and cathodic current densities, which can be explained by the adsorption of the organic compounds present in the inhibitor extracts at the active sites of the aluminum surface. As Those aromatic rings or multiple bonds, found in organic compound acted as mixed type inhibitor [20,21].

Table 3 indicates that, in the presence of Lactuca sativaextracts, \( E_{\text{corr}} \)shifted anodically with respect to the blank. Which indicates that the Lactuca sativaextracts acts as a mixed-type inhibitor with predominant anodic effectiveness [22-24].

The inhibition efficiency (ηw %) can be calculated from the electrochemical relation:

\[ \eta_w = \frac{i_{\text{corr}} - i_{\text{corr0}}}{i_{\text{corr0}}} \times 100 \]  

where \( i \) and \( i_{\text{corr}} \) are the corrosion current density values without and with inhibitor, respectively.

The results show that the inhibition efficiency increased and the corrosion current density decreased with the increased of inhibitor concentration.

Table 3. The values of corrosion potential (\( E_{\text{corr}} \)), corrosion current density (\( i_{\text{corr}} \)), anodic Tafel constant (\( \beta_a \)), cathodic Tafel constant (\( \beta_c \)), and inhibition efficiency (ηw % ) for aluminum in HCl in the absence and presence of different concentrations of Lactuca sativa extracts at 298K.

3.3 Application of adsorption isotherm

In our study different adsorption isotherms including Langmuir, Frumkin, Temkin and Freundlich were used to test the data obtained from weight loss measurements, and potentiodynamic polarization measurements to determine the possible adsorption mode. The result indicate that the best fit was obtained with the Langmuir adsorption isotherms. According to Langmuir isotherm $\theta$ is related to the inhibitor concentration $C_{inh}$ via [25].

$$\frac{C_{inh}}{\theta} = \frac{1}{K_{ads}} + C_{inh} $$  \hspace{1cm} (4)

Fig. 3 shows curve fitting of polarization and weight loss data a linear relationship was obtained and using the intercepts of the straight line $K_{ads}$ can be calculated, then $(\Delta G_{ads}^*)$ the standard energy of adsorption can be calculated [26].

$$\Delta G_{ads}^* = -RT \ln (K_{ads}) $$ \hspace{1cm} (5)

Where R is the universal gas constant and T is the thermodynamic temperature.

The regression coefficient $R^2$ and lines slopes and calculated standard energy of adsorption are listed in Table 4. The results indicates that the value of regression coefficient $R^2$ almost equal to unity, the slope of the straight line is almost unity, a high value of the adsorption equilibrium constant $K_{ads}$ and negative value of $\Delta G_{ads}^*$ which can be explain as follow the value of regression coefficient $R^2$ almost equal to unity confirmed that the adsorption of Lactuca sativa extracts on the metal surface follows Langmuir adsorption isotherm, a high value of the adsorption equilibrium constant $K_{ads}$ indicate the high adsorption ability of Lactuca sativa extract on the metal surface. The negative value of $\Delta G_{ads}^*$ means a spontaneous adsorption of Lactuca sativa extract on the metal surface and a strong interaction between inhibitor molecules and metal surface.[27-32].

3.4 The morphology investigation

The morphology of the aluminum surface in the absence and presence of 0.4 g/L Lactuca sativa extracts at 298K was investigated by SEM. Fig. 4a shows the SEM image of polished aluminum surface, the surface is smooth with no corrosion product. The SEM image for aluminum in 1M HCl shows that the surface is severely corroded due to the aggressive attack by HCl as we can see from Fig. 4b. In the presence of the inhibitor used in this study less corrosion attack was observed as we can see from Fig. 4c. The presence of inhibitor used in this study decreases the corrosion products on the metal surface which can be explained by the adsorption of the Lactuca sativa extracts as inhibitor on aluminum surface which protect the metal surface from corrosion by the adsorption of the organic compounds present in the inhibitor on aluminum surface.

![SEM images](image_url)

Fig 4: SEM image of aluminum electrode (a) polished, (b) in 1M HCl and (c) in 1M HCl with 0.4 M inhibitor.

4. Conclusion

1. Lactuca sativa extracts acts as a good inhibitor for the corrosion of aluminum in acidic media.
2. The inhibition efficiency of Lactuca sativa extracts increase with increasing the concentration of the extract.
3. The inhibition efficiencies obtained from potentiodynamic polarization and weight loss methods are in good agreement.
4. The adsorption of Lactuca sativa extracts on aluminum surface obeys Langmuir adsorption isotherm.
5. Potentiodynamic polarization curves reveal that Lactuca sativa extracts is a mixed-type inhibitor with predominant anodic inhibitor.
6. The value of $\Delta G_{ads}$ indicate that the adsorption of Lactuca sativa extracts was a spontaneous physisorption process.
